**Abstract** We report magnetic resonance (MR), computed tomography (CT) and angiographic imaging of an unusual giant arachnoid granulation

(GAG) in the superior sagittal sinus in a man with headache and vertigo. Intrasinus pressure measurements revealed a significant pressure gradient across the lesion. MR imaging is useful to identify GAG and dural sinus thrombosis, whereas dural sinus pressure measurement in certain cases of GAGs can be used to evaluate the lesion as the cause of the patient's symptoms.

**Keywords** Giant arachnoid granulation · Intrasinus pressure measurement · Benign intracranial hypertension

### Erratum

Unfortunately, this case was inadvertently published as a full case report in a previous issue of *European Radiology* (Vol. 18, No. 10 / October, 2008; pp. 2329–2332). We apologise for this oversight during the editorial process.

**Note:** Owing to the above-mentioned publication error, this case will not be included in the 2009 Interpretation Corner competition.
